Two View Geometry

- From two views
 - Can recover **motion**: 8-point algorithm
 - Can recover **structure**: triangulation
- Why multiple views?
 - Get more **robust** estimate of **structure**: more data
 - No direct improvement for **motion**: more data & unknowns

Course #23: Multiple-View Geometry for Image-Based Modeling. Lecture F: Geometry and Algebra of Multiple Views

Why Multiple Views?

- Cases that cannot be solved with two views
 - **Uncalibrated case**: need at least **three** views
 - **Line features**: need at least **three** views
- Some practical problems with using two views
 - **Small baseline**: good tracking, poor motion estimates
 - **Wide baseline**: good motion estimates, poor correspondences
- With multiple views one can
 - Track at high frame rate: tracking is easier
 - Estimate motion at low frame rate: **throw away data**

Course #23: Multiple-View Geometry for Image-Based Modeling. Lecture F: Geometry and Algebra of Multiple Views

Problem Formulation

Input: Corresponding images (of "features") in multiple images.
Output: Camera motion, camera calibration, object structure.

$$F(R_i, T_i, X^j) = \sum_{j=1}^n \sum_{i=1}^m \left\| \underbrace{x_i^j}_{\text{measurements}} - \underbrace{\pi(R_i X^j + T_i)}_{\text{unknowns}} \right\|^2$$

Course #23: Multiple-View Geometry for Image-Based Modeling. Lecture F: Geometry and Algebra of Multiple Views

Multiframe SFM as an Optimization Problem

- Can we minimize the re-projection error?

$$F(R_i, T_i, \mathbf{X}^j) = \sum_{j=1}^n \sum_{i=1}^m \left\| \underbrace{\mathbf{x}_i^j}_{\text{measurements}} - \underbrace{\pi(R_i \mathbf{X}^j + T_i)}_{\text{unknowns}} \right\|^2$$

- Number of unknowns = $3n + 6(m-1) - 1$
- Number of equations = $2nm$
- Very likely to converge to a local minima
- Need to have a good initial estimate
